Abacus.AI — Version 1.4 Changes

Date: September 11, 2026

Type: New Automation — New Client Setup Wizard

Agent: Abacus.AI

Summary

Added `New-Client-Setup.md` — a single Templater script that creates the complete client folder structure AND the full OPFMS note in one trigger. No manual folder creation needed. The script self-destructs after setup is complete.

How It Works

Trigger

`Cmd+P` → “Templater: Create new note from template” → select `New-Client-Setup`

What It Does (in sequence)

Step 1 — Collects all info upfront (one pass of prompts):

- Client First Name
- Client Last Name
- Email
- Mobile
- Date of Birth
- Job Title
- Organization / Company
- Program Start Date (defaults to today)
- Facilitator Name

Step 2 — Creates the folder structure:

```
01-Clients/FirstName-LastName/
├── Sessions/
└── Documents/
```

Step 3 — Generates the full OPFMS note:

- All YAML frontmatter pre-filled from prompts
- Participant Profile table pre-filled

- All sections ready for manual completion (personality, intangibles, wheel of life, etc.)
- Tags: `client` , `EPL12` , `ClientName` , `the-keystone-group`
- File named: `OPFMS-FirstName-LastName.md`

Step 4 — Opens the new OPFMS note directly

Step 5 — Self-destructs the temporary setup note (leaves no trace)

What the Wizard Does NOT Do

These still require manual input after setup:

- Personality Profile (run assessment first)
- Win-Win Challenges (discussion with client)
- Wheel of Life baseline scores
- Intangibles #1-3 (client co-defines scale levels)
- Important Facilitator Notes

Session notes are created individually per session (by design).

Technical Notes

- Uses `app.vault.createFolder()` for folder creation (silent fail if folder exists — safe to re-run)
- Uses `tp.file.create_new()` with inline content string (no sub-template call needed)
- Saves setup file path to `setupFilePath` BEFORE switching focus, then deletes it after
- The OPFMS content is a JavaScript template literal — all `${variable}` references resolve at runtime
